

Answer the following questions using relevant primary (field) data, secondary (research) data and other information that you have collected today. Make sure that you make reference to any statistical tests used and also evaluate the accuracy of your primary and secondary data.

1. Do an internet search for the **Butler Model of Tourism**. Does the development and decline of Boscombe as a tourist resort fit with this model?
2. Summarise any information you have that illustrates why Boscombe needs regenerating and what are the various viewpoints on this? Use your questionnaire results to help you with this section.
3. Briefly explain how a surf reef works and how the reef will enhance surf-related tourism in Boscombe.
4. Describe any patterns of environmental quality and other socio-economic indicators that you have measured and observed. Develop a hypothesis and test it using Spearman's Rank Correlation Test and explain the result.
5. Collate all the individual groups land use maps into a master map. What pattern would you have expected to find and does this map match your expectations? How do you think the types and location of landuses will change in Boscombe as a result of the regeneration project in Boscombe?
6. Do you have any evidence that the seafront regeneration is already working and if so, where are the improvements and who will benefit from them?
7. What were the strengths and what were the weaknesses of the fieldwork and secondary research that was undertaken today
